## $3 D \rightarrow 2 D$

- Implementing projection: (3D $\rightarrow$ 2D)
- Ray-tracing technique
- Motivation:
- From how we see!
- The ray is "traced" into the scene
- the first object hit is the one seen.
- In this case, the triangle $T 2$ is
 returned.

## Ray-tracing Basics (1/15)

## Ray-tracing Basics (2/15)

## Ray-tracing Basics (3/15)

## Ray-tracing Basics (4/15)

## Ray-tracing Basics (5/15)

## Ray-tracing Basics (6/15)

## Ray-tracing Basics (7/15)

| 0 | 0 | 0 | 1 | 1 | 0 | 0 | 0 |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| 0 | 0 | 1 | 1 | 1 | 1 | 0 | 0 |
| 0 | 1 | 1 | 1 | 1 | 1 | 1 | 0 |
| 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 |
| 0 | 1 | 1 | 1 | 1 | 1 | 1 | 0 |
| 0 | 0 | 1 | 1 | 1 | 1 | 0 | 0 |
| 0 | 0 | 0 | 1 | 1 | 0 | 0 | 0 |
| $M(i, j)$ |  |  |  |  |  |  |  |

## Ray-tracing Basics (8/15)

## Ray-tracing Basics (9/15)

- Computing one pixel at a time
- Each pixel "looks" in a direction
- Any object that is seen by a pixel
- intersect "viewing ray"
- viewing ray: line through that pixel is looking

## Ray-tracing Basics (10/15)

- Once that object is found, determine the color of the pixel.

## - a shading computation is need, that uses

- the intersection point
- surface normal ( $n$ )
- other information

## Ray-tracing Basics (11/15)

## Ray-tracing Basics (12/15)

## Ray-tracing Basics (13/15)

## Ray-tracing Basics (14/15)

|  |  |  |  |  |  |  |  |
| :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- |
|  |  |  | $a_{1}$ |  |  |  |  |
|  |  |  |  |  |  |  |  |
|  | $a_{2}$ |  |  |  |  |  |  |
|  |  |  |  |  |  |  |  |
|  |  |  |  |  |  |  |  |
|  |  |  |  |  |  |  |  |

## Ray-tracing Basics (15/15)

## Ray-Tracing Algorithm (1/3)

- A basic ray tracer therefore has three parts:
- ray generation:
- computes the origin and direction of each pixel's viewing ray.
- ray intersection:
- finds the closest object intersecting the viewing ray.
- shading:
- computes the pixel color based on the results of ray intersection.

## Ray-Tracing Algorithm (2/3)

- for each pixel do:
- compute viewing ray
- find first object hit by ray and its surface normal $\mathbf{n}$
- set pixel color computed from hit point, light, and $\mathbf{n}$

## Ray-Tracing Algorithm (3/3)

## - for each pixel do:

- computeviewing ray
- find first object hit by ray and its surface normal $n$--
- set pixel color computed from point, light, and $n$

$M(i, j)=\operatorname{shading}(L, H, n)<--^{\prime}$

## Practice Problems

1. Is the projected image on the image plane in the given example perspective?
2. Consider the following setup*:

- Image plane: Situated at $y=13$, parallel to $Z X$ plane, (Resolution: $11 \times 11$ ), $M$ is the corresponding array and $Y$-axis goes through $(6,6)$.
- Sphere: Center at $(0,0,0)$, Radius $=6$.
- Light: at $(0,15,0)$.

Now -
a) Draw the ray-tracing setup showing two viewing rays (one hitting, another missing).
b) Fill up the array (pixel) with 1 (for hitting) and 0 (for missing). Show the hitting/ missing mathematically for at least one pixel.
c) Fill up the array (pixel) with angles between surface normal and viewing ray. Show the angle calculation for at least one pixel.

* This problem can be helpful for understanding basic ray-tracing algorithm from the scratch.

## Thank You
